RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Your actions and decisions are respondsible for our future. Clean drinking water will continue to be one of Minnesota's greatest assets in the future, trust me, I have lived many places where you cannot drink the water. Before you put profits over people, I reccommend visiting Flint, Michigan.

Sincerely,
Savannah Villa

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

I am a Registered Nurse working in the metro area. Nurses know that damage to the environment - including damage caused by pollution of water supplies - harms the health of individuals, families, communities, and populations. I urge the MPCA to weigh these issues carefully and to prioritize health over corporate interests.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

Please make protecting Minnesota's drinking water and the public interest your agency's priority.
Who are the ultimate "stakeholders" in this fight for Minnesota's fresh water?
Is it foreign mining interests and corporate giants operating on daily stock prices and earnings ? Or is it the generations of Minnesotans today and into the future? You must "do your sworn job" and protect our water from myopic legislators and profiteers!

Sincerely,
Daniel Iverson

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

Clean potable water is the one of the most import things for LIFE - second only to air. Please protect our water!!

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

I can think of no charge to the MPCA that is more important than keeping our drinking water safe for families across the state, now and in the future. I welcome the the opportunity to comment on the Minnesota Pollution Control Agency's concepts for changes to drinking water Class 1 rules.

The MPCA, as our regulatory agency, should take these steps to protect drinking water in the public interest :

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Protecting Minnesota's drinking water from the kind of pollution that we have increasingly seen reported across the nation is a critical task for the MPCA. Please make it the priority it deserves.

Sincerely,
Beth Tamminen

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules. There is absolutely no reason to make changes to the Class 1 rules. Instead they should be left intact.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority and please do NOT change the existing rules.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.
It is WAY past time for our beautiful State of MN to strengthen the standards for drinking water. Pollutants are too often allowed to be tolerated by this Agency-seemingly in protecting big Ag and Companies. Too many wells, and areas are actually showing contamination. Once done almost impossible to undo.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals. Just imagine the cost and additional pollution the plastics for bottled water cause.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules. Across the country, and around the world we are seeing the devastating results as wealthy countries fail to maintain and upgrade standards and infrastructure that had previously guaranteed safe drinking water for citizens. This is a public health priority and should be addressed with ongoing diligence; after all, no water no life.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Jeanne Fahlstrom

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

In brief, our water quality protection rules in Minnesota should be strict, clear and enforceable, and it's up to the MPCA to make that happen.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

I grew up just outside of the city limits of Flint, Michigan. I now live in Ely, MN. My relatives and friends who still live in Flint, Michigan continue to live without safe, clean drinking water. My relatives throughout Michigan outside of Flint continue to fear for the safety of their drinking water because of inadequate protections from state and local governments. Do not let this happen anywhere in Minnesota. Protect us and the animals and plants around us from water pollution and water polluters. It is simply not worth it to risk additional pollution of the water we need to live.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.
I do not understand what the MPCAs role is if it is not to protect our water and to control pollution. The time is now to put the health of people and planet above the special interests of corporations. There should be no safe amount of pollution when it comes to our water and we should never have to fight so hard for basic needs. Water is life and deserves respect. What we do to our water we do to ourselves. Each individual working for these so called protection agencies needs to take a good look

at themselves. What is your responsibility? You are responsible for poisoning our water and should be held accountable to the people.
Please do right by the people of this state and fight to protect our resources. Thank you

Sincerely,

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.
The most precious element on our planet is H2O water is needed by each and every person. To risk the futures water for a temporary period of time so the extremely rich can line their pockets is absolutely ridiculous! Nonsense. I'm so sick of loopholes, and backdoor sneaky attorneys coming here to Minnesota especially the St Louis County Court House, when the former Secretary of State came did the very thing and Pete Stauber made the arrangements. ENOUGH! Water should be first! Peace Beth

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

If response to the Covid vaccines has taught us nothing else, it's shown us very clearly that many Minnesotans are highly against having foreign substances put into their bodies against their will. I KNOW THAT MANY OF MY FRIENDS AND NEIGHBORS WOULD BE EVEN MORE UPSET AND RESISTANT TO THE IDEA OF ALLOWING MORE CHEMICALS INTO OUR DRINKING WATER THAN THEY HAVE BEEN BY THE IDEA OF MANDATORY VACCINES! The reason we haven't seen the same level of uprising about this is that most people have no idea that you're considering allowing this. I know that I wasn't aware of it until I received an email from Water Legacy. I almost deleted it without reading it.

I hope you aren't counting on the same level of ignorance to allow you to pass these changes in water quality regulations. If we also have learned nothing else in the past several years, it's that the past does catch up with us. Our kids and grandkids will hold us - you in particular, in your roles as protectors of our water - accountable for the future they will be forced to live in. And, in fact, you yourselves could be the ones enduring chemotherapy and radiation treatment from drinking the water you fail to protect.

We inherited beautiful pristine waters and you have taken on the responsibility for keeping them that way. History will not be kind to you if you fail in that responsibility. Your children and grandchildren will say your name with the shame we are now heaping on our ancestors who were esteemed in their time as community leaders but who failed to stand up for the long-term well-being of all in their communities.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take the steps outlined by Water Legacy to protect drinking water and the public interest and to fulfill its mission as a regulatory agency.

Sincerely,
Sara Wright

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

As a Minnesota resident and taxpayer, I would like to thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The mission of the MPCA is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Thomas Probst
9340 84th St N

Stillwater, MN 55082

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

I am writing to comment on the MPCA's tentative plans for changes to drinking water Class 1 rules. I recently took a course primarily on Rivers taught by a retired Carleton Biology Professor who is an expert on these topics, and as a result I became much more aware of the various threats to clean water.

Our water must be drinkable and safe. State regulations need to prevent residents' risking their health from harmful levels of pollution, or allowing levels of such pollutants serious enough to require municipal governments to remove them rather than banning them at the source.

The MPCA's primary mission is to make the regulations that will prevent these negative outcomes. That is why the MPCA should take these steps to protect drinking water, both by making strong, evidence-based new ones and by NOT weakening existing standards:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority, just as it is intended to be.

Sincerely,
Joel Weisberg

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

With the alarmingly growing scarcity of water globally and within our own country, water must be protected. The extreme weather resulting from the climate emergency makes protecting our water imperative for life to go on. As a friend said recently," You can't drink oil, minerals or money." Water is truly Minnesota's greatest natural resource. Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Respectfully yours,

Doretta (Dorie) Reisenweber

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

As a natural resources professional, I thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules. Before I moved on to forestry, I held a Minnesota Class-A Water Treatment Plant Operator license and a Class-B Wastewater Treatment Plant Operator license.

Obviously, therefore, I believe our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

The people of Minnesota need to know that the Agency will represent them to the fullest extent. Pollution Control, mean just that. Anything less would be considered negligent. Water is the basis of all life. If we disregard that and look the other way, the costs are incomprehensible. No more reckless action by corporations who have little regard for what is right and just. We must stand for the health of our people,

land and all that we relay upon. The ripple effect is real.

Sincerely,
Linda Mockler

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

As a resident of MN for 76 years it is unconscionable that any resident of this land of 10,000 lakes cannot safely drink the water from their faucets. Whether the contamination is from the nitrates and pesticides in agrochemicals or the PFAs from manufacturing, we need to begin to truly tackle this huge problem. Since industrial agriculture is the cause of so much chemical contamination, there must be recognition of the value of using regenerative farming methods. The PFAs that are used in the manufacture of hundreds of products are another source of contamination - we must begin to tackle these issues out of respect for our environment and the wildlife dependent on clean water, and humans needing to coexist in this water rich state.

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Large portions of MN including the metro area have private wells (including me) and any pollution in an aquifer is going to stay in it as it is like a giant storage tank supplied by nature!

Sincerely,
Allan Frink

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Jon Hayenga

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Kathleen Felt

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
alice madden

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Barbara Brockway

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Marjorie Pitz

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Mark Anderson

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Michael Koppy

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
James Herther

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Chad Martin

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Karin Winegar

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Matthew Schaut

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Susan Dergantz

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Eleanor Haase

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.

Please make protecting Minnesota's drinking water and the public interest your agency's priority.

Sincerely,
Mary Smith

RE: MPCA Water Quality Standards for Drinking Water (Class 1 Rules)

Dear Ms. O'Dell, MPCA Staff, and Commissioner,

Thank you for the opportunity to comment on the Minnesota Pollution Control Agency's (MPCA) concepts for changes to drinking water Class 1 rules.

The MPCA's mission is to protect all Minnesota drinking water as one of our State's most unique and priceless resources, not just for today, but for future generations.

Our water must be drinkable and safe. Local residents shouldn't have to risk their health, buy bottled water, or pay high costs for water treatment because commodity agriculture is misusing pesticides and fertilizers or because industrial polluters are releasing toxic chemicals.

The MPCA should take these steps to protect drinking water and the public interest and to fulfill its mission as a regulatory agency:

1. Keep both National Primary and Secondary Drinking Water Regulations as Class 1 water quality standards. Minnesota Class 1 water quality standards should, without exception, be at least as strict as the most protective national drinking water standard.

2. Add water quality standards for all pollutants that the Minnesota Health Department has already researched and then adopted Health Risk Limits to prevent cancer and non-cancer health effects. This change would protect Minnesota drinking water from pollution containing pesticides, PFCs, toxic metals, and many other dangerous contaminants.

3. Control nitrates in surface water with a Class 2 standard that both protects aquatic life and reduces the threat to human infants when surface water enters groundwater. The MPCA has done the research needed to adopt this standard.

4. Oppose any changes in current rules that apply drinking water standards to Class 2A waters. These standards are needed to protect trout and other sensitive cold water species.

5. Strengthen the MPCA's enforcement of existing rules that protect Class 1 drinking water. The best way to protect Minnesota drinking water is to enforce the rules that are already on the books.
